Structural Consistency Does Not Reliably Predict Retrieval Utility

An Exact-and-Heuristic Audit of Preference-Graph Repair for Multi-Ranker Retrieval

SN Computer Science submission package (optional; journal guidelines do not require highlights)

1. Preference-graph repair is structurally active but not a validated nDCG gain.
2. Exact SCIP repair diagnoses greedy edge-deletion MWFAS suboptimality.
3. No Holm-corrected repaired-vs-unrepaired nDCG gain under this protocol.
4. Report construction, repair, extraction, and utility as separate evidence.
5. Missing Holm-corrected evidence is not proof of equivalence.
